The Atavism of Social Justice*

I

To discover the meaning of what is called "social justice" has been one of my chief pre-occupations for more than 10 years. I have failed in this endeavour — or, rather, have reached the conclusion that, with reference to a society of free men, the phrase has no meaning whatever. The search for the reason why the word has nevertheless for something like a century dominated political discussion, and has everywhere been successfully used to advance claims of particular groups for a larger share in the good things of life, remains however a very interesting one. It is this question with which I shall here chiefly concern myself.

But I must at first briefly explain, as I attempt to demonstrate at length in Volume 2 of my *Law, Legislation and Liberty*, why I have come to regard "social justice" as nothing more than an empty formula, conventionally used to assert that a particular claim is justified without giving any reason. Indeed that volume, sub-titled *The Mirage of Social Justice* is mainly intended to convince intellectuals that the concept of "social justice", which they are so fond of using, is intellectually disreputable.

Some, of course, have already tumbled to this; but with the unfortunate result that, since "social" justice is the only kind of justice they have ever thought of, they have been led to the false conclusion that all uses of the term "justice" have no meaningful content. I have therefore been impelled to show in the same book that rules of just individual conduct are as indispensable to the preservation of a peaceful society

* The 9th R.C. Mills Memorial Lecture delivered at the University of Sydney on October 6, 1976.

of free men as endeavours to realise "social" justice are in compatible with it.

The term "social justice" is today generally used as a synonym of what used to be called "distributive justice". The latter term perhaps gives a somewhat better idea of what is intended to be meant by it, and at the same time shows why it can have no application to the results of a market order. There can be no distributive justice where no one distributes. Justice has meaning only as a rule of human conduct, and no conceivable rules for the conduct of individual persons supplying each other with goods and services in a market order would produce a distribution which could be meaningfully described as just or unjust. Individuals might conduct themselves as justly as possible, but as the results for separate persons would be neither intended nor foreseeable by others, the resulting state of affairs could neither be called just nor unjust.

The complete emptiness of the phrase "social justice" shows itself in the fact that no agreement exists about what social justice requires in particular instances; also that there is no known test by which to decide who is right if people differ; and that no preconceived scheme of distribution could be effectively devised in a society whose members are free, in the sense of being allowed to use their own knowledge for their own purposes. Indeed, individual moral responsibility for one's actions is incompatible with the realisation of any such desired overall pattern of distribution.

A little inquiry shows that, though a great many people are dissatisfied with the existing pattern of distribution, none of them has really any clear idea of what pattern he would regard as just. All that we find are intuitive assessments of individual cases as unjust. No one has yet found even a single general rule from which we could derive what is "socially just" in all particular instances that would fall under it — except the rule of "equal pay for equal work". Free competition, precluding all the regard for merit or need and the like, on which demands for social justice are based, tends to enforce the equal pay rule.

II

The reason why most people continue firmly to believe in "social justice", even after discovering they do not really know what the phrase means, is that they think there must be something in the phrase, if almost everyone else believes in it. The ground for this almost universal acceptance of a belief, the significance of which people do not understand, is that we have all inherited from an earlier different type of society, in which man existed very much longer than in the present one, some now deeply ingrained instincts which are inapplicable to our present civilisation. In fact, man emerged from primitive society when in certain conditions increasing numbers succeeded, by disregarding those very principles which had held the old groups together.

We must not forget that before the last 10,000 years, during which man has developed agriculture, towns and ultimately the "Great Society", he existed for at least a hundred times as long in small food-sharing hunting bands of 50 or so, with a strict order of dominance within the defended common territory of the band. The needs of this ancient primitive kind of society determined much of the moral feelings which still govern us, and which we approve in others. It was a grouping in which, at least for all males, the common pursuit of a perceived physical common object under the direction of the alpha male was as much a condition of its continued existence as the assignment of different shares in the prey to the different members according to their importance for the survival of the band. It is more than probable that many of the moral feelings then acquired have not merely been culturally transmitted by teaching or imitation, but have become innate or genetically determined.

But not all that is natural to us in this sense is therefore necessarily, in different circumstances, good or beneficial for the propagation of the species. In its primitive form the little band indeed did possess what is still attractive to so many people: a unitary purpose, or a common hierarchy of ends, and a deliberate sharing of means according to a common view of individual merits. These foundations of its coherence, however, also imposed limits on the possible development of

this form of society. The events to which the group could adapt itself, and the opportunities it could take advantage of, were only those of which its members were directly aware. Even worse, the individual member of the group could do little of which others did not approve.

It is a delusion to think of the individual in primitive society as free. There was no natural liberty for a social animal. Freedom is an artifact of civilisation. An individual person had in the group no recognised domain of independent action; even the head of the band could expect obedience, support and understanding of his signals only if they were for conventional activities. So long as each must serve that common order of rank for all needs, which present-day socialists dream of, there can be no free experimentation by the individual.

III

The great advance which made possible the development of civilisation and ultimately of the Open Society was the gradual substitution of abstract rules of conduct for specific obligatory ends — and with it the playing of a game for acting in concert by following common indicators, by which a spontaneous order was self-generated. The great gain attained by this was that it made possible a procedure through which all relevant information widely dispersed was continuously made available to ever-increasing numbers of men in the form of the symbols which we call market prices. But it also meant that the incidence of the results on different persons and groups no longer satisfied the age-old instincts.

It has been suggested more than once that the theory explaining the working of the market be called *catallactics* from the classical Greek word for bartering or exchanging — *katalattein*. I have fallen somewhat in love with this word since discovering that in ancient Greek, in addition to "exchanging", it also meant "to admit into the community" and "to change from enemy into friend". I have therefore proposed that we call the game of the market, by which we can induce the stranger to welcome and serve us, the "*game of catallaxy*".

The market process indeed corresponds fully to the definition of a game which we find in *The Oxford English Dictionary*. It is "a contest played according to rules and decided by superior skill, strength or good fortune". It is in this respect both a game of skill as well as a game of chance. Above all, *it is a game which serves to elicit from each player the highest worthwhile contribution to the common pool from which each will win an uncertain share.*

The game was probably started by men who had left the shelter and obligations of their own tribe to gain from serving the needs of others they did not know personally. When the early neolithic traders took boat-loads of flint axes from Britain across the Channel to barter them against amber and probably also, even then, jars of wine, their aim was no longer to serve the needs of known people, but to make the largest gain. Precisely because they were interested only in who would offer the best price for their products, they reached persons completely unknown to them, whose standard of life they thereby enhanced much more than they could have that of their neighbours by handing the axes to those who no doubt could also have made good use of them.

IV

As the abstract signal-price thus took the place of the needs of known fellows as the goal towards which men's efforts were directed, entirely new possibilities for the utilisation of resources opened up — but this also required entirely different moral attitudes to encourage their exploitation. The change occurred largely at the new urban centres of trade and handicrafts, which grew up at ports or at the cross-roads of trade routes, where men who had escaped from the discipline of tribal morals established commercial communities and gradually developed the new rules of the game of catallaxy.

The necessity to be brief forces me here somewhat to over-simplify and to employ familiar terms where they are not quite appropriate. When I pass from the morals of the hunting-band in which man spent most of his history, to the morals which made possible the market order of the open society, I am jumping over a long intermediate stage, much

shorter than man's life in the small band, but still of much greater length than the urban and commercial society has enjoyed yet, and important because from it date those codifications of ethics which became embodied in the teaching of the mono-theistic religions.

It is the period of man's life in tribal society. In many ways it represents a transitional stage between the concrete order of the primitive face-to-face society, in which all the members knew each other and served common particular ends, and the open and abstract society, in which an order results from individuals observing the same abstract rules of the game, while using their own knowledge in the pursuit of their own ends.

While our emotions are still governed by the instincts appropriate to the success of the small hunting band, our verbal tradition is dominated by duties to the "neighbour", the fellow-member of the tribe, and still regarding the alien largely as beyond the pale of moral obligation.

In a society in which individual aims were necessarily different, based on specialised knowledge, and efforts came to be directed towards future exchange of products with yet unknown partners, common rules of conduct increasingly took the place of particular common ends as the foundations of social order and peace. The inter-action of individuals became a game, because what was required from each individual was observance of the rules, not concern for a particular result, other than to win support for himself and his family. The rules which gradually developed, because they made this game most effective, were essentially those of the law of property and contract. These rules in turn made possible the progressive division of labour, and that mutual adjustment of independent efforts, which a functioning division of labour demands.

V

The full significance of this division of labour is often not appreciated, because most people think of it — partly because of the classical illustration given by Adam Smith — as a designed intra-mural arrangement in which different in-

dividuals contribute the successive steps in a planned process for shaping certain products. In fact, however, *co-ordination by the market of the endeavours of different enterprises* in supplying the raw materials, tools and semi-finished products which the turning out of the final commodity requires, is probably much more important than the organised collaboration of numerous specialist workers.

It is in a great measure this inter-firm division of labour, or specialisation, on which the achievement of the competitive market depends, and which that market makes possible. Prices the producer finds on the market at once tell him what to produce and what means to use in producing it. From such market signals he knows that he can expect to sell at prices covering his outlays, and that he will not use up more resources than are necessary for the purpose. His selfish striving for gain makes him do, and enables him to do, precisely what he ought to do in order to improve the chances of any member of his society, taken at random, as much as possible — *but only if* the prices he can get are determined solely by market forces, and not by the coercive powers of government. Only prices determined on the free market will bring it about that demand equals supply. Not only this. Free market prices also ensure that all of a society's dispersed knowledge will be taken into account and used.

The game of the market led to the growth and prosperity of communities who played it, because it improved the chances for all. This was made possible because remuneration for the services of individual persons depended on objective facts, all of which no one could know, and not on someone's opinions about what they ought to have. But it also meant that, while skill and industry would improve each individual's chances, they could not guarantee him a specified income; and that the impersonal process which used all that dispersed knowledge set the signals of prices so as to tell people *what to do*, but without regard to needs or merits.

Yet the ordering and productivity-enhancing function of prices, and particularly the prices of services, depends on their informing people where they will find their most effective place in the overall pattern of activities — the place in which they are likely to make the greatest contribution to ag-

gregate output. If, therefore, we regard *that* rule of remuneration as just which contributes as much as possible to increasing the chances of any member of the community picked out at random, we ought to regard the remunerations determined by a free market as the just ones.

VI

However, they are inevitably very different from the relative remunerations which assisted the organisation of the different type of society in which our species lived so much longer, and which therefore still governs the feelings that guide us. This point has become exceedingly important since prices ceased to be accepted as due to unknown circumstances, and governments came to believe they could determine prices with beneficial effects.

When governments started to falsify the market-price signals, whose appropriateness they had no means of judging (governments as little as anyone else possessing all information precipitated in prices), in the hope of thereby giving benefits to groups claimed to be particularly deserving, things inevitably started to go wrong. Not only the efficient use of resources, but, what is worse, also the prospects of being able to buy or sell as expected — through demand equalling supply — were thereby greatly diminished.

It may be difficult to understand, but I believe there can be no doubt about it, that we are led to utilise more relevant information when our remuneration is made to depend indirectly on circumstances we do not know. It is thus that, in the language of modern cybernetics, the feed-back mechanism secures the maintenance of a self-generating order. It was this which already Adam Smith saw and described as the operation of the "invisible hand" — to be ridiculed for 200 years by uncomprehending scoffers. It is indeed *because* the game of catallaxy disregards human conceptions of what is due to each, and rewards according to success in playing the game under the same formal rules, that it produces a more efficient allocation of resources than any design could achieve.

I feel that in any game that is played because it improves

the prospects of all beyond those which we know how to provide by any other arrangements, the results must be accepted as fair, so long as all obey the same rules, and no one cheats. If they accept their winnings from the game, it is cheating for individuals or groups to invoke the powers of government to divert the flow of good things in their favour — whatever we may do outside this game of the market to provide a decent minimum for those for whom the game does not supply it.

It is not a valid objection to such a game, the outcome of which depends partly on skill and particular individual circumstances and partly on pure chance, that the initial prospects for different individuals, although they are all improved by playing that game, are very far from being the same.

The answer to such an objection is precisely that one of the purposes of the game is to make the full possible use of the inevitably different skills, knowledge and environment of different persons. Among the greatest assets which a society can use in this manner for increasing the pool from which individual earnings are drawn, are the different moral, intellectual and material gifts parents can pass on to their children — and often will acquire, create or preserve only in order to be able to pass them on to their children.

VII

The result of this game of catallaxy, therefore, will necessarily be that many have much more than their fellows think they deserve, and even more will have much less than their fellows think they ought to have. It is not surprising that many people should wish to correct this by some authoritarian act of re-distribution. The trouble is that the aggregate product which they think is available for distribution exists only *because* returns for the different efforts are held out by the market with little regard to deserts or needs, and are required to attract the owners of particular information, material means and personal skills to the points where at each moment they can make the greatest contribution. Those who prefer the quiet of an assured contractual income to the necessity of taking risks to exploit ever-changing opportunities feel at a disadvantage compared with possessors of

large incomes which result from continual re-disposition of resources.

High actual gains of the successful ones, whether this success is deserved or accidental, are an essential element for guiding resources to where they will make the largest contribution to the pool from which all draw their shares. We should not have as much to share if *that* income of an individual were not treated as *just*, the prospects of which induced him to make the largest contribution to the pool. Incredibly high incomes may thus sometimes be just. What is even more important, scope for achieving such incomes may be the necessary condition for the less enterprising, lucky, or clever to get the regular income on which they count.

The inequality that so many people resent, however, has not only been the underlying condition for producing the relatively high incomes which most people in the West now enjoy. Some people seem to believe that a lowering of this general level of incomes — or at least a slowing down of its rate of increase — would not be too high a price for what they feel would be a juster distribution.

There is an even greater obstacle to such ambitions today. As a result of playing the game of catallaxy, which pays so little attention to imagined "social" justice but does so much to increase output, the population of the world has been able to increase so much, without the real incomes of most of the people increasing very much. We can maintain it and the further increases in population which are irrevocably on the way, only if we make the fullest possible use of that game which elicits the highest contributions to productivity.

VIII

If people in general do not appreciate what they owe to catallaxy and how far they are even dependent on it for their very existence, and if they often bitterly resent what they regard as its injustice, this is so because they have never designed it, and therefore do not understand it. The game rests on a method of providing benefits for others in which the individual will accomplish most if, within the conven-

tional rules, he pursues solely his own interests — which need not be selfish in the ordinary sense of the word, but are in any case his own.

The moral attitude which this order demands not only of the entrepreneur but of all those, curiously called "self-employed", who have constantly to choose the directions of their efforts if they are to confer the greatest benefit on their fellows, is that they compete honestly according to the rules of the game, guided only by the abstract signals of prices and giving no preferences because of their sympathies or views on the merits or needs of those with whom they deal. It would mean not merely a personal loss, but a failure in their duty to the public, to employ a less efficient instead of a more efficient person, to spare an incompetent competitor, or to favour particular users of their products.

The gradually spreading new liberal morals, which the Open or Great Society demanded, required above all that the same rules of conduct should apply to one's relationship to all other members of society — except for natural ties to the members of one's family. This extension of old moral rules to wider circles most people, and particularly the intellectuals, welcome as moral progress. But they apparently did not realise, and violently resented when they discovered it, that the equality of rules applicable to one's relationship to all other men necessarily implied not only that new obligations were extended to people who formerly had no such claims, but also that old obligations which were recognised to some people, but could not be extended to all others, had to disappear.

It was this unavoidable attenuation of the content of our obligations, which necessarily accompanied their extension, that people with strongly ingrained moral emotions resented. Yet these are kinds of obligations which are essential to the cohesion of the small group, but which are irreconcilable with the order, the productivity, and the peace of a great society of free men. They are all those demands which under the name of "social justice" assert a moral claim on government that it gives us what it can take by force from those who in the game of catallaxy have been more successful than we have been. Such an artificial alteration of the relative attractiveness of

the different directions of productive efforts can only be counter-productive.

If expected remunerations no longer tell people where their endeavours will make the greatest contribution to the total product, an efficient use of resources becomes impossible. Where size of the social product, and no longer their contributions to it, gives individuals and groups a moral claim to a certain share of that product, the claims of those who really deserve to be described as "free riders" become an unbearable drag on the economic system.

IX

I am told there are still communities in Africa in which able young men, anxious to adopt modern commercial methods, find it impossible thereby to improve their position, because tribal customs demand that they share the products of their greater industry, skill or luck with all their kin. An increased income of such a man would merely mean that he had to share it with an ever-increasing number of claimants. He can, therefore, never rise substantially above the average level of his tribe.

Similarly, the chief adverse effect of so-called "social justice" measures in our society is that they prevent individuals from achieving what they could achieve — through the means for further investment being taken from them. It is also, the application of an incongruous principle to a civilisation whose productivity is high *because* incomes are very unequal, and thereby the use of scarce resources is directed and limited to where they bring the highest return. Thanks to this unequal distribution, the poor get in a competitive market economy more than they would get in a centrally-directed system.

All this is the outcome of the — as yet merely imperfect — victory of the obligatory abstract rule of individual conduct over the common particular end as the method of social co-ordination — the development which has made both the Open Society and individual freedom possible, but which the socialists now want to reverse. Socialists have the support of inherited instincts, while maintenance of the comparatively

recent wealth which creates the new ambitions requires an acquired discipline which the non-domesticated barbarians in our midst, who call themselves "alienated", refuse to accept although they still claim all its benefits.

X

Let me before I conclude briefly meet an objection that is bound to be raised because it rests on a very widespread misunderstanding. My argument that in an evolving process of cultural selection we have built better than we understood, and that what we call our intelligence has been shaped concurrently with our institutions by a process of trial and error, is certain to be met by an outcry of "social Darwinism". But such a cheap way of disposing of my argument by labelling it would rest on an error.

It is true that during the latter part of the last century some social scientists, under the influence of Darwin, placed an excessive stress on the importance of natural selection of the most able individuals in free competition. I do not wish to under-rate the importance of this, but it is not the main benefit we derive from competitive selection. This is the competitive selection of cultural institutions.

For the discovery of this we did not need Darwin, since the growing understanding of it in fields like law and language tended to help Darwin to his biological theories. The problem under consideration is not genetic evolution of innate qualities, but cultural evolution through learning, which indeed leads sometimes to conflicts with near-animal natural instincts.

Nevertheless, it is still true that civilisation grew — not by the prevailing of that which man thought would be most successful — but by the growth of that which turned out to be so; and which, precisely because he did not understand it, led man beyond what he could ever have conceived.
